

As a field ecologist for many years, I was privileged to work in many beautiful places, and witness many amazing plants, animals, and ecosystems. However, at some point I wanted to do more than simply collect data – I wanted to increase my contribution to conservation and sustainability of our planet.

Thus I added GIS and remote sensing technology to my skills in the hope that I could improve the ease, efficiency, and quality of field data collection.

More recently I have also added html and css, i.e. the creation of web pages in order to reach more people as the internet continues to link peoples from all countries and cultures.

My other interests are skydiving and in the rescue and rehabilitation of dogs and cats. I have fostered many a sweet dog, cried when they were adopted, and had a few foster 'failures', but managed to limit myself to (currently) two wonderful dogs as my companions and best friends.

With those things in mind, I would like to give encourage you to check out a non-profit called Working dogs for Conservation, (<http://wd4c.org/>) an organization which adopts dogs from shelters and trains them to do conservation work.
